Time series models; models which take advantage of variation over time in a single unit; and pooled time series (sometimes called cross-sectional time series or time series cross-sectional) models; which utilize variation across both time and spatial units; are very common in political science. While these models offer substantial leverage over important social science problems that use purely cross-sectional data, there are a number of pitfalls that are necessary to avoid during estimation.

The history of Jerusalem and the stories that have given it prominence in the religious imagination continue to shape much of the world in which we live. How does this perceived holiness come about? What happens when holy places are destroyed and rebuilt? We will examine the biblical stories about Jerusalem not only as important sources themselves, but also for how they shape later religious traditions, specifically Judaism, Christianity, and Islam. As such, we will address what it means for the same place to be perceived as holy by differing, and often competing, groups. These contestations regarding Jerusalem will, then, allow us to engage issues of religious diversity and conflict both historically and in the present.
